JOB MARKET PAPER	When Careers Stall: Early-Career Job Insecurity and Fertility over the Life Cycle <i>Abstract:</i> Can greater exposure to job insecurity at labor-market entry have lasting effects on fertility? We study Spain's 1984 reform, which sharply expanded fixed-term hiring for new entrants while preserving protection for permanent workers. Using differences in reform exposure across nearby birth cohorts of low- and high-skilled women, we find that the reform increased years of non-permanent employment and lowered contribution-based income among low-skilled women, without a detectable change in days worked. Exposed low-skilled cohorts experienced a 15.2% decline in births per woman at the cohort level and delayed first motherhood by about five months. Mechanism evidence suggests that employment insecurity constrains the realization of fertility plans, with exposed low-skilled women more likely to have fewer children than they desire. We build and estimate a life-cycle model linking early-career employment risk to fertility decisions over the reproductive horizon. Within the model, post-entry employment instability and accumulated insecurity account for most of the fertility decline, while reducing insecurity permits some births to be recovered by age 40. Together, the evidence shows that reforms increasing early-career job insecurity can delay motherhood and reduce realized fertility.	

WORKING PAPERS	How do economic shocks impact upon the effect of retirement on mental health? (with Bruce Hollingsworth & Eugenio Zucchelli). <i>R&R in Journal of of Demographic Economics</i>
	The Role of Early Life Conditions on the Development of Child's Adaptive Behaviour Skills (with Edith Aguirre). <i>R&R in European Journal of Health Economics</i>
